

TechDemoSat-1: A software test bed for CCSDS SM&C

Modern service oriented software for space

Nicholas Holt (SSTL)
Andy Brewer (SSTL)
Mark Doyle (CGI)
Johannes Klug (CGI)

Topics

- TechDemoSat-1 (TDS-1)
- Software Experiments
- Test Bed System
- CCSDS SM&C
- Why SOA
- Next Steps

TechDemoSat-1

- Is a collaborative project to bolster the UK's thriving space industry by providing a low-cost opportunity for innovative commercial and research payloads under development in the UK to gain flight heritage.

- Launches Q3 2013
- Mission Operations managed through Satellite Applications Catapult at Harwell.

OBC750 & Software Experiments

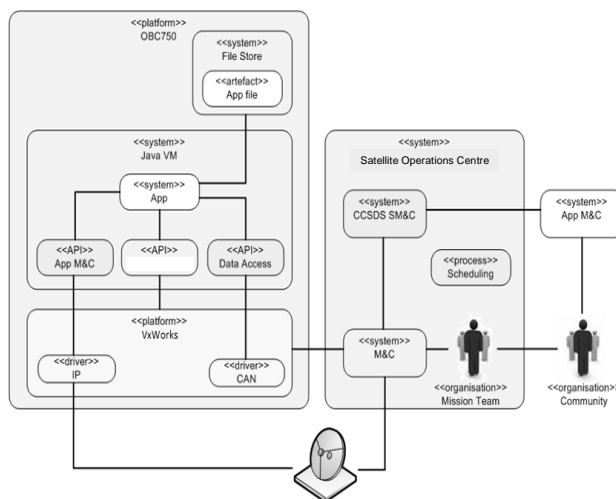

- TDS-1 flies SSTL's OBC750 next Generation On-Board Computer.
 - New Product Development
- High-performance OBC:
 - 1333 Dhrystone 2MIPS,
 - 296 Whetstone MWIPS
 - 16 MiBytes EEPROM for boot software
 - 256Mbytes RAM memory
 - IP comms with ground.
- On TDS-1 there are spare resources to operate the satellite and run software experiments:
 - OBC750 provides memory protection mechanisms in Hardware and Operating System
- Anticipated that operational time will be available to run software experiments after 1st year of operations
 - This will provide a unique test bed allowing approaches to be validated in orbit.
 - The aim is to reduce the barriers to fly novel techniques and promote innovation.

Test Bed System

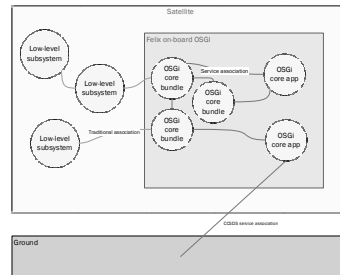

- SSTL and Logica (now CGI) have been working together on new approaches to Satellite System Software.
 - Next Generation On-Board Software (NGOBS) project
 - Aim to run on TechDemoSat-1
- Aims:
 - To use COTS open-source approaches and software where possible
 - Reduce barriers to development – e.g Avoid expensive toolsets.
 - Allow flexibility to easily move functionality around system.
 - To investigate mechanisms to implement CCSDS SM&C protocols.
- Initially looked at feasibility of flying Android on Satellites.
 - We successfully ran Android on OBC750
 - Chose alternative approach - Java Test-Bed using JamaicaVM
 - Lower risk approach as we wanted to run VxWorks together with Test-Bed.
 - Didn't need many of the Android functions
 - Development could still use Open-Source Toolsets.
- Ground System - Hummingbird Open-Source Mission Control System
 - Java Based

Test Bed System - TDS

Test Bed - OSGI

- The team chose to employ OSGI for Satellite Test-Bed System.
 - OSGi technology is a set of specifications that define a dynamic component system for Java.
 - Applications are (dynamically) composed of many different (reusable) components.
- Advantages:
 - Service Modularisation
 - Service and Application Management
 - Resource Management
 - Service and Application Security
- Technology exists and widely supported.
 - Already in use for Hummingbird.
- We chose to use 'Felix' implementation for on-board system
 - Lighter weight than Karaf used for Hummingbird

ESAW 2013

Test Bed: Services Implemented on board.

- Broadcast Telemetry
- Solicited Telemetry
- Telecommand:
 - Basic level to OBC tasks
 - Basic level to CAN (Satellite TT&C network)
 - Firewall layer incorporated to protect satellite.
- Messaging (socket comms) User defined
- Felix/OSGI provides:
 - Application Deployment
 - Web Services
 - http bundle
- File Transfer:
 - Saratoga protocol
 - Standard ftp

Bundle ID	Name	Version	Category	State	Dependencies
001	org.osgi.core	4.2.0	OSGi	Active	None
002	org.osgi.framework	1.4.0	OSGi	Active	None
003	org.osgi.service.component	1.2.0	OSGi	Active	None
004	org.osgi.service.http	1.2.2	OSGi	Active	None
005	org.osgi.service.http.whiteboard	1.0.0	OSGi	Active	None
006	org.osgi.service.http.whiteboard.anchor.provisioning	1.0.0	OSGi	Active	None
007	org.osgi.service.http.whiteboard.runtime	1.0.0	OSGi	Active	None
008	org.osgi.service.http.whiteboard.servlets	1.0.0	OSGi	Active	None
009	org.osgi.service.http.whiteboard.web	1.0.0	OSGi	Active	None
010	org.osgi.service.http.whiteboard.web.servlets	1.0.0	OSGi	Active	None
011	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
012	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
013	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
014	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
015	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
016	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
017	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
018	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
019	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None
020	org.osgi.service.http.whiteboard.web.servlets.impl	1.0.0	OSGi	Active	None

Felix On-board Web Console

ESAW 2013

CCSDS SM&C

- The Team wanted to use the NGOBS project to explore CCSDS SM&C aspects
- Findings:
 - Difficult to find information on implementation details.
 - Standards incomplete with regards standardised services
 - Standards can be interpreted in multiple ways.
 - Goals of Standard was sound.
- Decision
 - Develop own services to satisfy SM&C goals.
 - Protocol and language agnostic.
 - Where possible match SM&C API implementation (Java)
 - Use COTS approaches and Tools

CCSDS SM&C approach

- Hummingbird provides SM&C proxy for Satellite
- Comms between Client and proxy to use HTTP, JSON and XML
 - Protocol and language independent.
- Implemented system for SM&C Parameter Service Status.
- OSGi Bundle created to brokers requests.
- This approach can then be expanded for other SM&C services

CCSDS SM&C: Deployment on-board

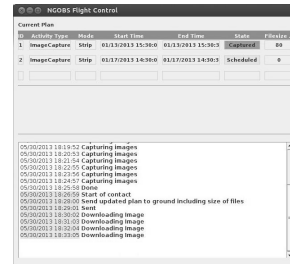

- On-Board system could service SM&C requests directly (without using proxy)
- Need to consider restricted link speeds to OBC
 - TDS-1: Uplink – 19k2 bit/s Downlink 38k4 bits/s
 - Using http, JSON etc... introduces overheads
- Recommendations
 - For routine services using more of link: Employ proxy
 - Also helps with flow control to/from satellite.
 - For services with lower data requirements and experiments quicker to develop based on Satellite servicing requests.
 - Note: More work in this area is necessary
- Because Satellite and Ground use common approaches, easier to adapt system!

Why SOA? – Example Benefit to Mission

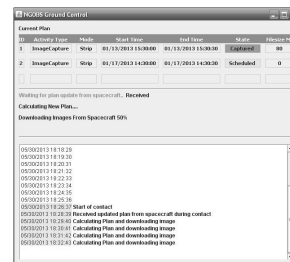

- Team wanted to ensure that there is a tangible benefit of SOA to mission in addition to potential cost savings.
 - Explain using example.
- Potential Benefit: Opens up new ways of autonomously operating Satellites!
 - Exchange of information can be much more dynamic and hence CONOPS can be evolved.
 - Approach to updating software makes it quicker to adapt system to optimise operations during service.
- Case Study: Imaging Payload Operations.
 - We identified that we can get more useful data from an Imaging Satellite in two ways:
 - Adjust Imaging Schedule to take account of actual compression ratios achieved.
 - Choose to discard Images for download based on Cloud Maps
- Current scheme.
 - No interaction between Planning System and Satellite during contact.
 - i.e. Telemetry received is processed and passed to MPS post-pass
 - Any change to plan is communicated on next contact.
 - This limits the potential benefits.

Why SOA? – Example Benefit to Mission

- Envisaged Scenario – Every contact:
 - Pre-Contact*
 - MPS receives Weather info (Web Services link)
 - MPS re-plans deciding not to download certain Images. (No point in downloading cloudy images)
 - During Contact*
 - At start of Satellite contact the MPS can delete the files & issues new download schedule
 - MPS requests file sizes of Images on-board
 - MPS re-plans using the received info to adjust Imaging Plan
 - MPS sends new schedule to Satellite.
- Result: We are getting more useful data from Satellite, by changing operational scheme.
- We have prototyped a demo showing this scheme in action!
 - Uses Test-Bed
 - Based on data exchanged for DMC satellites.

Demo: Progress Monitoring of OBC

Demo: Progress Monitoring of OBC

Next Steps

- Launch & commission TDS-1.
- Commission payloads
 - OBC750 is a new product development.
- Call for Software Experiments
 - These don't have to use Java Test-Bed.
 - Expect operational time for experiments to be available after 1st year of operation.
 - Experiments will need to be co-ordinated with Satellite Applications Catapult.
 - See <http://sa.catapult.org.uk/>
 - Primarily for UK Industry and Academia
- Experiments expected to question classical separation of Ground and Space Systems
 - Test Bed for Space Software
 - E.g. CCSDS SM&C and file based operations.
- Use outcome of experiments for future missions!

Thank you
